Sequence 10, Application US/10037677A
Patent No. 6706503
GENERAL INFORMATION:
APPLICANT: Schellenberger, Volker
APPLICANT: Liu, Amy D.
TITLE OF INVENTION: Directed Evolution of Microorganisms
FILE REFERENCE: GCS60-D1
CURRENT APPLICATION NUMBER: US/10/037,677A
CURRENT FILING DATE: 2001-10-23
PRIOR PILICATION NUMBER: US 09/314,847
PRIOR PILICATION OF SEQ 1D NOS: 17
SOFTWARE PERSEQ for Windows Version 4.0
SEQ ID NO 10
LENGTH: 11

Patent No. 6864052

GENERAL INFORMATION:

APPLICANT: Drmanac, R.

APPLICANT: Kita, D.

APPLICANT: Xu, C.

TITLE OF INVENTION: ENHANCED SEQUENCING BY HYBRIDIZATION USING POOLS OF PROBES

FILLE REPRENCE: 3031/35918

CURRENT APPLICATION NUMBER: US 60/115,284

PRIOR APPLICATION NUMBER: US 60/115,284

PRIOR FILING DATE: 1999-01-06

NUMBER OF SEQ ID NOS: 71

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 48, Application US/0852384

Patent No. 6110667

GENERAL INFORMATION:

APPLICANT: LOPEZ-NIETO, CARLOS E

APPLICANT: INGAM, SANJAY KUMAR

TITLE OF INVENTION: PROCESSES, APPARATUS AND COMPOSITIONS FOR

TITLE OF INVENTION: CHARACTERIZING NUCLEOTIDE SEQUENCES

FILE REFERENCE: 2458-4029

CURRENT FILING DATE: 1996-11-15

NUMBER OF SEQ ID NOS: 122

SOFTWARE: PATENTIN NOS: 2.1
                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ; OTHER INFORMATION: Description of Unknown Organism: Primer US-08-522-384-48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WESULT 41

; Sequence 25, Application US/08882164D
; Patent No. 6306624
; GENERAL INFORMATION:
    APPLICANT: Beckett, Barbara R., Jones, Glenville
    TITLE OF INVENTION: Retinoid Metabolizing Protein
    NUMBER OF SEQUENCES: 43
    CORRESPONDENCE ADDRESS:
    ADDRESSE: Blake, Cassels & Graydon
    STREET: Box 25, Commerce Court West
    CITY: Toronto
    STATE: Ontario
    COUNTRY: Canada
    ZIP: MSL 1A9
    COMPUTER: READABLE FORM:
    MEDIUM TYPE: Diskette, 3 1/2 inch, 1.4 Mb storage
    COMPUTER: WORD PERFECT
    COMPUTER: WORD PE
                                                                                                                                                                                                                                                                                            0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Indels

Sequence 6, Application US/09535754

Patent No. 6361974

Patent No. 6361974

APPLICANT: DIVERSA CORPORATION

APPLICANT: DIAVAKHISHVILI, TSOTHE

APPLICANT: BIONAL SHORT, Jay

APPLICANT: PREY, Gerhard

TITLE OF INVENTION: EXONUCLEASE-MEDIATED NUCLEIC ACID REASSEMBLY IN DIRECTED EVOLUTIC

TITLE OF INVENTION: EXONUCLEASE-MEDIATED NUCLEIC ACID REASSEMBLY IN DIRECTED EVOLUTIC

CURRENT APPLICANTON NUMBER: US/09/535,754

CURRENT RILING DATE: 2000-03-27

PRIOR APPLICATION NUMBER: US 09/522,289

PRIOR FILING DATE: 2000-03-09

NUMBER OF SEQ ID NOS: 14

SOFTWARE: Patentin version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-10-087-426-6

Sequence 6, Application US/10087426

Patent No. 6708841

GENERAL INFORMATION:

APPLICANT: DITURESA CORPORATION

APPLICANT: SHORT, Jay M.

TITLE OF INVENTION: EXONUCLEASE-MEDIATED GENE ASSEMBLY IN DIRECTED EVOLUTION

FILE REPRENCE: DIVERIA60-23

CURRENT APPLICATION NUMBER: US/10/087,426

CURRENT APPLICATION NUMBER: US/2-03-01

Sequence 10, Application US/09498557

Patent No. 6713279

GENERAL INFORMATION:

APPLICANT: DIVERSA CORPORATION:

APPLICANT: SHORT, Jay

TITLE OF INVENTION: NON-STOCHASTIC GENERATION OF GENETIC VACCINES AND ENZYMES

FILE REFERENCE: DIVER.460-12

CURRENT APPLICATION NUMBER: US/09/498,557

CURRENT APPLICATION NUMBER: US 09/332,835

PRIOR PELING DATE: 1999-06-14

PRIOR PELING DATE: 1999-06-14

PRIOR PELING DATE: 1999-03-26

PRIOR PELING DATE: 1999-03-09

TITLE OF INVENTION: ENHANCED SEQUENCING BY HYBRIDIZATION USING POOLS OF PROBES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     US-10-029-221C-5

Sequence 5, Application US/10029221C

Patent No. 69396DI

Patent No. 69396DI

APPLICANT: SHORT, JAY M.

APPLICANT: DAVAKHISHVILI, TSOTNE D.

APPLICANT: DAVAKHISHVILI, TSOTNE D.

TITLE OF INVENTION: EXONUCLEASE-MEDIATED NUCLEIC ACID REASSEMBLY IN

TITLE OF INVENTION: DIRECTED EVOLUTION

FILE REPERENCE: DIV-1466-21

CURRENT APPLICATION NUMBER: US/10/029,221C

CURRENT APPLICATION NUMBER: US/10/029,221C

PRIOR PILING DATE: 1995-12-07

PRIOR PELING DATE: 1995-12-07

NUMBER OF SEQ ID NOS: 13

SOFTWARE: PATENTH VET. 2.1

SEQ ID NO 5:

LENGTH: 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ; OTHER INFORMATION: Description of Artificial Sequence: Illustrative; OTHER INFORMATION: restriction enzyme recognition site US-10-029-221C-5

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

Novel primer for diagnosing polycystic kidney disease-associated disorder, comprises regions having sequence that selectively hybridizes to polycystic kidney disease gene sequence.

Claim 6; Page 100; 192pp; English.

The present invention relates to compositions and methods useful for the identification and detection of polycystic kidney disease (PKDI) gene mutations. The invention also relates to primers comprising a 5' region baving a sequence that selectively hybridises to a PKDI gene sequence and optionally, to a PKDI homologue sequence and an adjacent 3' region having a sequence that selectively hybridises to a PKDI gene sequence and not to a sequence that selectively hybridises to a PKDI gene sequence and not to a pKDI homologue sequence. Primer pairs of the invention are useful for detecting the presence or absence of a mutation in a PKDI polymucleotide in a sample, for identifying a subject at risk for a PKDI-associated disorder in a subject. They are useful for electively amplifying a region of a PKDI gene. PKDI DNA fragments are useful detecting the presence of a mutant gene. PKDI DNA fragments are useful detecting the presence of a mutant reaction, in hybridisation or amplification assays of biological samples to detect abnormalities of PKDI expression and for engineering transgenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, coingomers are also used for acidovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo int/pub/published_pct_sequences

The present invention describes a recombinant adeno-associated virus (AAV) vectored ribozyme composition (I). (I) comprises: (a) at least a first ribozyme that specifically cleaves an mRNA encoding a protein, colypeptide, or peptide selected from the group of rod opsin, iNOS. (RDS/peripherin, VEGFRI, VEGFRI, adenosine A-2B receptor, IGF-1, integrin alpha 3, integrin alpha 5, or integrin alpha V; (b) a vector comprising a polymucleotide encoding the ribozyme, where the polymucleotide operably positioned downstream of at least a first promoter that directs expression of the polymucleotide in a selected comprising the ribozyme or the polymucleotide; (d) an AAV vector comprising the ribozyme or the polymucleotide; (d) an AAV vector comprising the ribozyme or the polymucleotide; or (e) a host cell comprising the ribozyme or the polymucleotide; or (e) a wist cell comprising the ribozyme or the polymucleotide; or (e) a comprising the ribozyme or the polymucleotide; or (e) a comprising the ribozyme or the polymucleotide; or (e) a dost cell or retinal cell of a mammalian eye, comprising providing to the eye the composition described above, and for a time effective to specifically cleave the mRNA in the cell. (I) has ophthalmological activity, and can be used in gene therapy. (I) can be used for treating a medicament for degeneration. (I) is also useful for manufacturing a medicament for treating the diseases mentioned above, including autosomal dominant contines or a blood-retaing the associative of severity. Or evertice or events of the event of events or extended the events of events or extended the events of events or extended above, including autosomal dominant or retain degeneration. (I) is also useful for manufacturing a medicament for treating the diseases mentioned above, including autosomal dominant for treating the events of the events of even ö for treating, decreasing the severity, or ameliorating the symptoms of a pathological condition, e.g. atrophic or pigmented lesions of the eye, blindness, a reduction in central or peripheral vision, or a reduction in total vision. ABZ72763 to ABZ72953 represent sequences used in the Gaps disease, e.g. diabetic retinopathy or age-related macular ; Score 10.4; DB 1; Length 14; Pred. The present invention relates to a novel substrate having an oxide layer, which is useful in optically detecting a target material. The thickness of the oxide layer may vary to the wavelength of excitation light used. This claimed is a method for detecting a target material, comprising immobilizing a probe material on substrate, reacting the immobilized probe material and the target material, illuminating a reaction product by the excitation light, and measuring light emitted from the invention, microarrays were fabricated by forming fused silica (SiO2) layers on silicon wafers, followed by linkage with a coupling agent and mimobilization of oligonucleotide probes. The microarrays were then incubated with labeled oligonucleotides and exposed to excitation light, and light emitted from the target oligonucleotides and exposed to excitation light, and light emitted from the target oligonucleotides and exposed to excitation light, can under the intensity of detected signals with respect to the thickness of the SiO2 layers. ADZ85128-ADZ85203, MODY 3 diabetes-associated probes used with the target sequence of human glyceraldehyde-3-phosphate oligonucleotide is detected using a microarray including a substrate with a no oxide layer a good signal is obtained compared to that with no oxide ö SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic. Substrate for use in optically detecting target materials, comprises an oxide layer having thickness that may vary to wavelength of excitation light used. Gaps Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine ; 0 Oligonucleotide SEQ ID NO 20774 for detecting SNP TSC0004222. acid (PNA) oligomers for detecting single nucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fitp.wipo.int/pub/published_pot_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, and ABF00010-ABF89989, and the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire printed specification, but fire wipo.int/pub/published_pct_sequences

   This invention describes a novel method for generating an antisense library targeted to a selected RNA transcript. The methods can be used for identifying antisense agents and for identifying target sites for antisense—mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. AAZ23783-Z23798 represent RNA fragments derived from the Herpes simplex virus genome which are used to illustrate the method of the invention
  Production of antisense libraries, used for identifying antisense agents and for identifying target sites for antisense-mediated inhibition of a selected gene.

PCR primer used in method for detecting bacterial DNA in food, SEQ ID 37.
   The present invention relates to a foodstuff testing method. The method comprises extracting bacterial DNA fragment from foodstuff, amplifying the DNA fragment by Single Strain Counting-PCR (SSC-PCR) method. The amplified linear fragment is analyzed and the recycling method of foodstuff is determined based on the analysis result. The present primer was used to illustrate the method of the invention.
  Escherichia coli; Bacillus; Shigella; bacterial strain identification;
  Foodstuff testing method involves amplifying DNA fragment of bacteria extracted from foodstuff, by single strain counting polymerase chain reaction method.

The invention relates to a novel method for identifying bacteria by amplifying DNA of the bacteria by PCR using a primer of specific sequence, electrophoresing the amplified DNA, obtaining an electrophoretic image and identifying whether the bacteria is a predetermined strain of Escherichia coli, Bacillus or Shigella by the appearance and position of DNA-fragment length within the electrophoretic image. The method of the invention may be useful for specifically identifying bacteria. The current sequence is that of the bacterial strain identification-related PCR primer of the invention.
  The invention relates to a novel oligonucleotide for selecting a wilting bacterial-disease resistance carnation. The oligonucleotide for selecting a wilting bacterial-disease resistance carnation is selected from ADR05232, ADR05233, ADR05233, ADR05233, ADR05233, ADR05234, ADR05234, ADR05236 or ADR05237. The oligonucleotide is useful for identifying a wilting bacterial-disease resistance carnation, which involves extracting DNA from the carnation, using it as a template, performing amplification of the DNA by PCR using one or a combination of the oligonucleotides, and carrying out electrophoresis analysis of the obtained amplified product. This polynucleotide sequence represents a wilting bacterial-disease resistance
  Identifying bacteria by amplifying DNA of bacteria by PCR, electrophoresing amplified DNA, obtaining electrophoretic image and identifying if bacteria is predetermined strain of Escherichia coli by DNA-fragment length.
  Novel oligonucleotide useful for identifying wilting bacterial-disease resistance carnation and for selecting wilting bacterial-disease resistance carnation.
   Wilting bacterial-disease resistance carnation PCR primer, SEQ ID 2.

  This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence and for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010, ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but

  The present invention relates to a novel substrate having an oxide layer, which is useful in optically detecting a target material. The thickness of the oxide layer may vary to the wavelength of excitation light used. Also claimed is a method for detecting a target material, comprising immobilizing a probe material on a substrate, reacting the immobilized probe material and the target material, illuminating a reaction product with excitation light, and measuring light emitted from the reaction product by the excitation light. In an example from the invention, concluded by forming flued silica ($iso2 layers on silicon wafers, followed by linkage with a coupling agent and incubated with labeled oligonucleotide probes. The microarrays were then incubated with labeled oligonucleotides and exposed to excitation light, and light emitted from the target oligonucleotides was measured, to evaluate the intensity of detected signals with respect to the thickness of the $ior layers. Ab28128-Ab285203, MODY 3 diabetes-associated probes used with the target sequence of human apprendichy a target oligonucleotide is detected using a microarray including a substrate with collisonal collisons.

This oligonucleotide comprises a reverse primer specific to the novel human fchd540 gene (see AAT94468) that is up-regulated in endothelial cells subjected to shear stress. It was used with primer for T11XC in a differential display paradigm used to detect genes that are differentially expressed in endothelial cells under fluid shear stress. Shear stress is thought to be responsible for the prevalence of atherosclerotic lesions in areas of unusual circulatory flow. The novel fchd540 gene can be used in the diagnosis and treatment of cardiovascular
  New strains of Agaricus bisporus with improved cap whiteness - compared with the UI strain but retaining other desirable features of this strain.
   The sequence is that of an RAPD (random amplified DNA) primer which was used in the isolation of an Agaricus bisporus mushroom strain which has whiter caps, less scaling than known strains, particularly for mushrooms produced in the first break, so it is more valuable (suitable for marketing fresh rather than canning). It also retains the desirable characteristics (good cap shape and shelf life, thick stem and veil) of

The patent discloses methods for the treatment and diagnosis of cardiovascular diseases by novel human genes (fingerprint genes) which are differentially expressed in different cardiovascular disease states. Compositions which can modify TGF-beta signalling pathway are identified by screening. These are used therapeutically to treat fibroproliferative beta related disorders, especially TGF (Transforming growth factor) beta related disorders, including diabetic retinopathy, inflammation, artherosclerosis, pancreatic cancer, angiogenesis, fibrosis, tumour growth and vascularisation. The present sequence is the reverse PCR primer used to study the differential display of fingerprint gene, find540. Differential display was performed on endothelial cells subjected to laminar shear stress compared with static control. fchd540 was detected as up-regulated under shear stress

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleouides are used for diagnosis and/or prognosis of cancer and a crange of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE099999, ABE00010-ABE199999 and ABE00010-ABIS2073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPD at
  Gaps
  Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine

The invention relates to determining whether a subject has or is at risk of developing glaucoma, retinal degenerative disease, or a cardiovascular disease, comprishes generating a transcriptional or translational profile (i.e. 'fingerprint') in the subject or in a sample obtained from the subject, based on the expression of the different myocilin (MYOC, also known as trabecular meshwork inducible glucocorticoid responsive protein, TIGR) mRNA species or polypeptide forms, where a difference in the profile relative to that in a normal subject indicates that the subject has or is at risk of developing the above-mentioned diseases. Also included are: (1) a method for establishing MYOC genetic population or profile in a population of individuals having glaucoma, retinal degenerative disease, or a cardiovascular degenerative disease, or a cardiovascular disease, comprising determining MYOC genetic profile of an individual and comparing the individual and degenerative disease, or a cardiovascular disease, comprising determining MYOC genetic profile to MYOC genetic profile to MYOC genetic profile of an individual and a kit for determining whether a subject has or is likely conference or comparing to the novel MYOC pentide probe capable of specifically binding to the novel MYOC polypeptide probe capable of specifically binding to the novel MYOC polypeptide probe capable of specifically binding to the novel MYOC polypeptide probe capable of specifically binding to the novel MYOC polypeptide probe capable of specifically capting pigmentosa, macular degeneration, Usher syndrome, congenital certinitis pigmentosa, macular degeneration, Usher syndrome, congenital confinence and anthored as a stroke, acute endocarding in the programment of the acute or a cardiovascular confinence and anthored as a stroke, acute endocarding the congenital confinence as a machine as a stroke, acute endocarding the congenital confinence as a machine as a stroke, acute endocarding the congenital and a such congenital and a such congenital and a su
  mentioned diseases in a subject. The present sequence represents the 3' flanking sequence surrounding the deletion present in a MYOC cDNA variant
  hypertensive heart disease, arrhythmia and arteriosclerotic heart disease), and in screening assays for the identification of therapeutics and the evaluation of their effectiveness for treating the above-
     transcriptional or translational profiles based on myocilin

The invention relates to a polynucleotide (I) for synthesizing labeled protein and having ability to increase labeling efficiency of labeling compound, where protein is produced by adding labeling compound to 3' terminal of sequence encoding target protein of gene template, where labeling compound has label portion and acceptor portion having compound capable of binding to C-terminus of label portion and translating gene template in presence of labeled compound. (I) is useful for producing a labeling protein, which involves preparing a gene template by adding (I) to the 3'-terminal of base sequence encoding the target protein. Which involves preparing a gene template by adding (I) to the 3'-terminal of base sequence encoding the translating the gene template in the presence of the labeling compound containing acceptor portion and label portion, and obtaining protein synthesized in the translation system. The base sequence encoding the target protein either contains the termination codon or does not contain synthesized in the translation. The labeled protein (LPI) is useful in a performance-analysis of a protein, which involves contacting the test substance. (I) has the ability to increase labeling efficiency of a labeling compound and thus effectively produces labeled the the minimal contain. This sequence corresponds to a sequence used in the method of
  polynucleotide having ability to increase labeling efficiency of ing compound, useful for synthesizing labeled protein in presence of

expression) tags used to identify mRNA transcripts encoding immunostimilatory cofactor procession which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be referentially or differentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell chertication of the cytotocxic immune response, particularly against tumour cells, mour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, that can lyse for against a tumour antigen; to modulate the genotype of an APC; to screen for an APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially copperated cost induce of an expression of musing to the monocyte lineage. Cells containing these genes con an eused in active immunotherapy (or to stimulate production of antigen specific effector cells) and vectors containing them are used in active immunotherapy. Co-administration of tumour antigens and presentation of entigen specific effector cells and entire of containing the presentation of co-stimulatory signals, migration to T cell-rich sites, presentation of cell-rich services and upregulates the APC for the presentation of cell-rich services and upregulates the APC for the presentation of cell-rich services and upregulates the APC fo

Sequences AA2/791-2-47.09 represent SAGE (serial analysis or gene expression) tags used to identify mank transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while cother transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell cother transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated costimulatory factors play an important role in the cother transcripts or the cytotoxic immune response. particularly against tumour cells. Immunostimulatory cofactors also also being required for complex) and subsequent recognition by T-cell receptors is alone the tumour cells, immunostimulatory cofactors also being required for cefficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Ancelec an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for against a tumour antigen; to modulate the genotype of an APC; and as hybridisation probes/amplification propels, prognosis and monitoring of diseases related to abnormal cypression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proceins, can be used to adaining to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a complexated costimulatory factors ensures adequate antigen and containing the presentation of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of antigen-specific effector effector cells or the condensuration of an e
   ö
   presentation to endogenous APCs and upregulates the APCs for the presentation of co-effigulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
   The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-rype specific, cancer specific or ubiquitouely expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
  New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonamontated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of dentifying human genes which are involved in cell cycle progression of contiguous nucleotidas of a NORF gene whose expression in a yeast contiguous nucleotidas of a NORF gene whose expression in a yeast cell with a candidate drug and controling expression in the yeast cell with a candidate drug and controling expression in the yeast cell with a candidate drug and controling expression in the yeast cell with a candidate drug and controling expression in the yeast cell of at least 1 NORF gene may be used to identification of the cell cycle, the differentially expression is affected by the class of three cell cycle, the differentially expression is dentification of and freet phases of the cell cycle. The cycle methods may be used to identify candidate drugs which affect the cell cycle and for identification of the present invention. AAF31262 to AAF41664

Kinzler K; Vogelstein B, Yeast gene coding sequences comprising NORF genes with serial analysis of

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open readding frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene whose expression varies by at cycle comprising administering a NORF gene whose expression varies by at cycle comprising administering a NORF gene whose expression of phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 comprising contacting an NORF gene whose expression varies as in M1.

CC and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell of at least 1 NORF genes whose corpression is affected by the class of drugs. The NORF genes may be used as markers of phases of the cell cycle, the differentially expression is affected by the class of drugs. The NORF genes may be used as markers of phases of the cell cycle, the differentially cycle and for identify candidate drugs. Apr3326 to Apr44064 cycle and for identification of antifungal drugs.   creening for candidate drugs to treat diseases related to the Expression careening for candidate drugs to treat diseases related to CHRNE. The method of the invention is useful for haplotyping the CHRNE. The method of the invention is useful for haplotyping the CHRNE gene in an individual, and can also be used in pharmaceutical research to validate CHRNE as a candidate target for, and in design of clinical trials of candidate drugs for, treating a specific condition drugs or disease in the target region may be determined by the use of allele-specific oligonucleotides (ASOS; ABL88370-ABL88320) as probes and primers, and by primer extension using oligonucleotide primers comprising sequences ABL88371-ABL88371-ABL88370-ABL88370-ABL88370-ABL88370-ABL88370-ABL88370-ABL88371-ABL88371-ABL88371-ABL88371-ABL88371-ABL88371-ABL88371-ABL883731-ABL
   ö
   The invention relates to a method for haplotyping the cholinergic receptor, nicotinic, epsilon polypeptide (CHRNE) gene (ABL88268) of an individual, and also describes 17 novel polymorphic sites within the human CHRNE gene. The CHRNE gene is located on chromosome 17p13-12 and contains 12 exons which encode a 493 amino acid protein (ABB49112). The CHRNE protein is one of the 5 subunits of mammalian acetylcholine receptors (ACHRS) found at neuromuscular junctions in juveniles and adults, and is essential for the normal postnatal development of skeletal muscle. Whateions in the CHRNE gene are associated with congenital myasthenic syndrome (CMS). CHRNE gene sequences can therefore be used in gene, therapy. The CHRNE gene is also useful for studying the expression

reductase (GSR) gene (I). (I) has antianaemic activity and can be used in gene therapy. (I) can be used in screening for drugs targeting (I) that gene therapy. (I) can be used in screening for drugs targeting (I) that invention can be used: for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating cliseases associated with GSR activity; for haplotyping, which is also used by the pharmaceutical research scientist to validate GSR as candidate target for treating a specific condition or disease predicted to be associated with GSR activity, e.g. haemolytic anaemia, and in the Gesign of clinical trials for treating a specific condition of disease associated with GSR activity, and for screening compounds targeting GSR.
(I) is useful in studying the expression and function of GSR, and in corporate and the stop of the condition of GSR activity. (I) is also useful in studying the expression and function of GSR, and in the diseases related to GSR activity. (I) is also useful in studying the expression and function of GSR as well as on the biological activity of GSR as well as on the biological activity of GSR as well as on the biological activity of GSR as well as on the biological activity of GSR as well as the binding affinity of candidate frugs targeting GSR for the treatment
   The present invention describes genetic variants of the human glutathione
   of haemolytic anaemia. The present sequence represents a preferred oligonucleotide detection primer for the human GSR gene, which is given in the exemplification of the present invention

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are expressed in activated human Th1 and/or Th2 cells. The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CATG-3' sequence motify lying nearest to the polyA region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes captessed in Th1 and/or Th2 cells, antibodies against these proteins, and inhibitors of the expression of groups of genes tage sexpressed in either or both the two cell types. Groups of genes expressed in and/or Th2 cell types may be used for the diagnosis and treatment of Th1 and/or Th2 cell types may be used for the diagnosis and treatment of Th1 and Th2-related disorders. Sequences ABV78390-ABV78560 are SAGE tags representing 171 genes which are more highly expressed in Th1 cells compared with Th2 cells ö Human activated Th1 and Th2 cell expression gene group, useful for the diagnosis and treatment of Th1 and Th2-related diseases. 44.2%; Score 8.4; DB 1; Length 10; 90.0%; Pred. Novel polymorphic variants of crystallin, beta B1 useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases e.g. cataract.

The invention relates to an isolated polynucleotide comprising a sequence which is a polymorphic variant of a reference sequence for crystallin, beta B1 (CRYBB1, located on chromosome 22q12.1) gene or their fragment, where the polymorphic variant comprises a CRYBB1 isogene defined by a Claim 17; Page 13; 94pp; English.

The present invention provides the gene, protein and cDNA sequences of the human endothelial differentiation, G-protein coupled receptor 6 (EDGS). Also identified are single nucleotide polymorphisms (SNPs) found

Claim 18; Page 14; 111pp; English.

Inflammation.

New genetic variants of endothelial differentiation, G-protein coupled receptor-6 gene for studying expression, function of the gene and expressing EDG6 protein for use in screening drugs to treat cancer,

  The invention relates to haplotyping the protocadherin 2 (PCDH2) gene, comprising determining which of the haplotypes given in the specification defines one or both copies of the individual's pCDH2 gene. The polymorphisms are within a 3044 base pair sequence (ABAG5413), fully defined in the specification. The polymorphic variants are useful in studying the expression and function of FCDH2, in expressing PCDH2 protein for use in screening for candidate drugs to treat diseases such as cancer, related to PCDH2 activity, in studying the effect of the variation on the biological activity of PCDH2 and the binding affinity of candidate drugs targeting PCDH2. The haplotyping methods are useful in validating PCDH2 as a candidate target for treating a specific condition or disease predicted to be associated with PCDH2 activity or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with PCDH2 activity, The present sequence
within the sequences. The sequences can be used in the identification of the haplotype of an individual, and in the treatment of cancer. angiogenesis and inflammation. The present sequence is an allele specific primer extension oligonucleotide for the EDG6 gene, which is found on

   The invention relates to genetic variants of human carboxylesterase 2 (CES2) gene. Polymorphic variants of CES2 gene are useful in studying the expression and function of CES2, and in expression CES2 proteins for use in screening candidate drugs to treat diseases associated with CES2 activity, e.g. cancer or substance abuse/addiction. Establishing CES2 happlotype or haplotype pair of an individual is useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with CES2 activity. Haplotype information is useful in improving the efficiency and output of several steps in drug discovery and development process, including target validation, identifying lead compounds, and early phase clinical trials. The transgenic animals are useful for studying expression of the CES2.

This invention describes a novel in vitro method for identifying genes
that are significant for hair-bearing skin in humans. The method
comprises recovering, from hair-bearing skin in humans. The method
comprises recovering, from hair-bearing skin a first mixture of
genetically expressed (transcribed and optionally translated) factors
(i.e. proteins, mRNA or their fragments), recovering a second, similar
mixtures from skin on which hair does not grow and subjecting both
mixtures to serial analysis of gene expression (SAGB) to identify those
consection which expression is markedly different between the two types of
skin. The invention also describes in vitro methods for determining
cosmetic and pharmaceutical agents for use against disorders or
cosmetic and pharmaceutical agents for use against disorders or
cosmetic and pharmaceutical agents for use against disorders or
cosmetic and pharmaceutical agents for use against disorders or
commobilised probes are also described for determining homeostasis. The
immobilised probes are also described for determining homeostasis. The
comparing skin is from the scalp and the other skin is from the face.
The method allows identification of as many as possible of the genes
important for hair-bearing skin, and therefore, of a very wide range of
  ö
  In vitro identification of genes important for hair-bearing skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
(M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis, atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag

Reverse transcribing human immunodeficiency virus RNA in clinical samples with novel HIV-specific oligonucleotide reverse transcription primers.
   The present sequence is a reverse transcription primer used in a method for the detection of human immunodeficiency virus (HIV) RNA in a biological sample. The HIV RNA is reverse transcribed to generate cDNA. This is then amplified by PCR and the PCR product is detected either by gel electrophoresis, followed by ethidium bromide staining, or using 5'-biotin-labelled primers during amplification. The use of HIV-specific biotin-labelled primers provides a sensitive method for detecting HIV-1 and/or HIV-2 in plasma. This method can reduce the incidence of false negative results in screening of patients or blood supply for HIV. (Updated on 15-SBP-2003 to standardise OS field)

  Sequences shown in AAV65401 to AAV65580 represent PCR primers used in the
  course of the invention which provides a method for determining a single stranded nucleic acid base sequence. The method comprises separation of 4k oligonucleotide probe as a primer from all combinations of k base sequences and hybridising the probe and the nucleic acid to be tested. The probe is elongated to make a primer using the nucleic acid to be tested. Tested as a template and the elongated primer is determined. The base sequence of the nucleic acid is determined based on the elongated amount. The method allows sensitive and rapid determination of nucleic acid base sequence without mismatch in hybridisation as in sequencing by

  New nucleic acid ligand comprising a parallel-stranded hairpin, useful as aptamers, as artificial nucleic acid ligands and for detecting and
                             detecting
  The invention relates to a nucleic acid ligand comprising a parallel-stranded hairpin. Also described: (1) a method for preparing a parallel oligonucleotide duplex, and (2) a method for binding a target molecule. The parallel-stranded hairpin sequences or oligonucleotide triplexes are useful as aptamers. They are useful for detecting and eliminating molecules of interest. The ligand is useful as artificial nucleic acid ligand. The present sequence represents a parallel stranded hairpin
gene to produce fluorescently labelled product, contacting the labelled product with first and second array of oligonucleotide probes, detecting fluorescent hybridisation signal and correlating with tendency to rifampin resistance. The method is useful for detecting a tendency to rifampin resistance caused by mutations in a rpoB gene of M. tuberculosis. The method is easy to perform and is cost effective to be performed on a large-scale basis. The results produced is reliable and readily detectable. The method is easily adaptable to automation. The present sequence represents a M. tuberculosis PCR primer.

Sequences AAZ79710-Z79916 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts which are differentially expressed in a variety of normal or malignant cell types. Some of the transcripts correspond to known genes or ESTS (expressed some of the transcripts correspond to known genes or ESTS (expressed to sequence tags) which were previously unknown to be preferentially or differentially expressed in that particular cell type, while other transcripts correspond to novel genes. The invention also provides a nucleotide comprising a promoter sequence derived from one of the differentially expressed genes, which may optionally be operably linked to a foreign nucleotide sequence, and gene delivery vehicles and host cells comprising the polynucleotides of the invention. A nucleotide comprising sequences AAZ79710-Z79916 may be used in diagnostic procedures to characterise a cell of a specific tissue type and to determine whether it is normal or malignant. They may be used to screen for agents that modulate expression of differentially expressed genes compound. The promoter/foreign gene construct of the invention may be used for example, a promoter derived from a gene preferentially expressed in dendritic cells (antigen-presenting cells, or APC8), may be operably construct of the invention may be operably to an infmunostimulatory molecule and a second construct of the invention may be operably constructed expression of the foreign gene in a particular cell significant processed in dendritic cells (antigen-presenting cells, or APC8), may be operably constructed expression of constructed expression of constructed may be observed in the manner of the invention may be operably constructed expression of constructed may be observed in the
  Such a construct could be transduced into
   sequence encoding an antigen. Such a construct could be transduced int APCs and would be useful for inducing an immune response by educating immune effector cells in vivo, or in cancer immunotherapy

The present invention describes an lipopolysaccharide (LDS) activated human monocyte expression gene group consisting of the high-ranking 50 genes of the highest expression among the genes expressed by human monocyte stimulated by LDS in which the cDNA of each gene has the base sequence of (AAH32628 to AAH32677) continuous to the base sequence 5'-(CATG-3' nearest to the polyA region. The gene group is useful for the development of new means for the diagnosis and the treatment of various human diseases in which human monocyte plays an important role. AAH32628 to AAH32943 represent specifically claimed LPS activated human monocyte expression gene cDNA taggs from the present invention. AAH3294 represents an LPS activated human monocyte axpression gene cDNA taggs from the present invention. AAH3294 represents an LPS activated human monocyte expression gene cDNA sequence encoding AAB98009, which are given in the exemplification of the present invention
   The invention relates to a human normal hepatocyte expression gene group comprising 200 genes in the human normal hepatocyte. The CDNA of each

  The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AA461161-AA464724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the
  New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular

gene comprises one of 200 fully defined nucleotide sequences as given in the specification. The gene group and the cDNAs corresponding to each of the genes in the group are useful in the diagnosis and treatment of human hepatopathy. The present sequence is a cDNA corresponding to a gene expressed by normal human hepatocytes
  The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA83081-ABA83122, ABA83180, ABA831812 and ABA83180 or segments thereof (ABA83133-ABA83169, ABA83179, ABA83181 and ABA83183). The methods of the invention are useful for at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer and in tests for monitoring disease status in a patient being treated for ovarian cancer. The methods can additionally be used to identify a paticular tumour as being an ovarian tumour selected from

The present invention relates to a new polynucleotide comprising a nucleotide sequence which comprises lipase, hormone sensitive (LIDE) isogenes. The invention is useful in screening for drugs targeting LIPE isogenes that are useful for treating obesity and male sterility. The isogenes that are useful for improving the efficiency and creliability of several steps in the discovery and development of drugs for treating diseases associated with LIPE activity. The polynucleotide is useful in studying the expression and function of LIPE, and in corporate to LIPE protein for use in screening for candidate drugs to treat diseases related to LIPE activity. It is also useful in studying the effect of the variation on the biological activity of LIPE as well as on the binding affinity of candidate drugs targeting LIPE for the treatment of obesity and male sterility. The invention is useful for studying the expression of LIPE isogenes in vivo, for in vivo screening and testing of the drugs targeted against LIPE protein, and for testing the efficacy of therapeutic agants and compounds for treating obesity and male sterility in a biological system. The present nucleic acid sequence represents one of a collection (ABK96026-ABK96083) of oligonucleotide primers that were corporated in the invention to detect polymorphisms in the human LIPE gene

  The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleuklin.8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
  Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.

   The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that
  Identifying agents that alter biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity

g 8888888 ò Š 셤 . 0 The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; subburn; psoriasis; scleroderma; The sequences given in AAC85259-64 represent mutated promoter sequences which were used with the E. coli mutD coding sequence in the method of the invention to prepare an evolved microorganism. The method comprises culturing a microorganism having a heterologous mutator gene, for at least 20 doublings to select an evolved microorganism, where the gene generates a mutation rate of at least 5 - 100 000 fold relative to wild type. The evolved microorganism is then rescored to a wild type mutation rate. A mutator gene is defined in the specification as being a DNA repair gene which comprises a mutation and which has impaired proof reading function. The method is useful for directing the evolution of a microorganism, i.e., directing desired genetic change in microorganisms in response to selective pressure. Microorganisms are produced that are ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag Directing evolution of microorganisms to produce microorganisms able to grow under conditions suitable for production of useful products, comprises using mutator genes and extreme conditions. This invention describes a novel in vitro method for identifying genes that are significant for hair-bearing skin in humans. The method comprises recovering from hair-bearing skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixtures to serial analysis of gene expression (SAGS) to identify those genes for which expression is markedly different between the two types of skin. The invention also describes in vitro methods for determining of homeostasis of human hair-bearing skin and for determining activity of cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human hair-bearing skin. A biochip and the test of the propersion of as many as possible or rigid) with immobilised probes are also described for determining homeostasis. The hair-bearing skin is from the scalp and the other skin is from the face. The method allows identification of as many as possible of the genes important for hair-bearing skin, and therefore, of a very wide range of potential therapeutic and cosmetic agents. This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other human tissue, preferably skin from a protected area, especially from the breast and subjecting the mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes and in vitro method for determining homeostasis of human facial skin; a test kit which comprises a solid support (flexible or rigid) on which are kit which comprises a solid support (flexible or rigid) on which are important bind specifically to the factors of interest and a bicchip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of commetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identification of as many as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic agents. AD031911-AD035111 represent human DNA Tag fragments used to
   In vitro identification of genes important for facial skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.

   The present invention relates to a method which comprises of a non-amplified oligonuclectide detection assay configured for detecting at least one Connexin 26 (Cx26) allele. The method of the invention is useful for the detection and characterisation of mutations associated with non-syndromic hearing impairment (NSHI). The invention is also useful for using invasive cleavage structure assays to screen nucleic acid samples for the presence of mutations in the connexin 26 or gapjunction beta 2 gene (GJB2) associated with non-syndromic hearing loss.
   New Kit comprises non-amplified oligonuclectide detection assay configured for detecting at least one Connexin 26 allele, useful for screening nucleic acid samples for the presence of mutations in the connexin 26 or gap-junction beta 2 gene.

The invention relates to a method of analyzing haplotype, by detecting gene polymorphism in drug-related genes such as aryl acetylamide deacetylase, arylalkylamine Nacetyl transferase or Ary-binding cassette, sub-family A (ABC1), member 1. The method is useful for analyzing of a medicine or a foreign material, for selecting medicine for carefording casses. Complexing addition or a foreign material, for selecting medicine for medicine for preventing or treating diseases, for determining appropriate dosage of medicine for preventing or treating a disease, for analyzing a drug incrarction, and for determining the related polymorphism relative to the sensitivity of the medicine, foreign material or disease. The disease include malignant tumor, immune disorder circulatory disease, metabolic disease, kidney disease, respiratory disease and muscle associated clisease. It he method enables analysis of the individual differences related to the sensitivity of a medicine, using a haplotype, without using each single nucleotide polymorphism. The present sequence

  fibromatosis which is characterised by bi-lateral schwannomas. The NF2 is a neuro-
fibromatosis which is characterised by bi-lateral schwannomas. The NF2
"gene" has been shown by linkage studies to be assigned to chromosome 22.
The missing or mutated gene in NF2 patients has been shown to be the merlin gene. The gene encodes a protein, merlin (moesin-erzin-radixin-
like protein), which possesses tumour suppressor activity, and whose tumour suppressor activity is mediated by inter-actions with the cytoskeleton. The merlin gene is found on chromosome 22 between the known markers D22S1 and D22S28. In patients suffering from NF2, the merlin gene is gene in which a mutated, A mutant merlin protein may be encoded by a gene in which a mutation of A to T at the first position of the codon encoding amino acid 220 causes the substitution of Tyr for Asn. The merlin gene may be used in gene therapy for the treatment of a merlin-
merlin gene may be used in gene therapy for the treatment of a merlin-
merlin gene may be used in gene therapy for the treatment of a merlin-
sesciated tumour or NF2, or for prevention of schwannoma, meningioma, posterior capsular lens opacities, deafness or hearing loss, balance
disorders or paralysis. (Updated on 25-MAR-2003 to correct PN field.)

A method has been developed for the diagnosis of cancer in potentially neoplastic samples. The method comprises comparing the level of transcription between RNA transcripts in two tissues samples (which are of transcription between RNA transcripts in two tissue samples (which are of the same type), where the first sample is potentially neoplastic, and the second sample is normal human tissue. The first sample is categorized as conclusive it is level of transcription is lower than that off the second sample. The transcript is selected from Alu, RAS, U6 snRNA, 16S RNA, EGR-1, ribosomal protein S27, ETS-1, 28S RNA, CGR11, and LIMK-2, and it is clentified by a tag selected from Alu, RAS, up present sequence represents a serial analysis of gamma actin. The present sequence represent invention. The use of SAGE tags provides an extensive profile of gene expression in rat embryo fibroblast (REF) cells containing the (non) functional p53 tumour suppression gene. The discovery of new SAGE tags, which are regulated by p53, enables the diagnosis of genes that are

calls Tumour antigen presentation via the MFC (major histocompatibility cells. Tumour antigen presentation via the MFC (major histocompatibility cells. Tumour antigen presentation via the MFC (major histocompatibility cells. Tumour antigen presentation by T-cell receptors is alone insulficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTES). Nucleic caid sequences identified using the SAGE tags have several potential uses.

They may be used in vaccines to induce an immune response particularly correspond against a tumour antigen; to modulate the genocype of an APC; to screen for agents that modulate expression of differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the capprosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expression of these genes. Detection of the dendritic cell differentially expression of their encoded proteins, can be used to identify can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing them act used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the correction of T cell growth factors and secretion of chemokines for recruitment of immune effector cells ö SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss. preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridiaation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), or particularly an antispen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells. E.g. cytotoxic T lymphocytes, and these used for adoptive ö The present invention describes a group of genes consisting of 100 genes which are highly expressed in human dendritic cells; a group of genes which are expressed at a higher frequency in human dendritic cells than in human monocytes; and a group of genes which are expressed at lower frequency in human enderitic cells than in human monocytes. Each group of genes are characterised in that cDNAs of these genes respectively have the base sequences of SEQ ID NO:1 to 100 (AAC74014), SEQ ID NO:201 to 200 (AAC74014 to AAC74113) and SEQ ID NO:201 to 300 (AAC74114) to AAC74113) and SEQ ID NO:201 to 300 (AAC74114) Groups of genes expressed in human dendritic cells at a greater or lesser extent than in monocytes for investigation and diagnosis of autoimmune disease and tumors. The present sequence is a probe used to demonstrate the method of the invention, which is concerned with the use of pools of probes to enable sequencing by hybridisation, a process known as SBH. Overlapping probes are used which allows the identification of sequences longer then the probe length, and either the target nucleic acid or the probe is labelled. The method of the invention is useful for assembling sequences and in parallel analyses

The invention relates to a novel method for the detection of polymorphisms in a DNA sequence. Test DNA and a second DNA are amplified with at least one pair of primers, and the sequence differences between the amplicons are compared. The primers are based on oligonucleotide control of the amplicons are compared. The primers are based on oligonucleotide sequences that are over-represented in the genome of the relevant conganism, and which are biased to one strand. The method can be used to identify an organism by species, serotype or strain, in which case amplicons are analysed for products, common to all members of the species, and those specific for strain or serotype, and the results compared with an existing database. The method can also be used to identify an individual, by comparison of results for a test DNA with an existing database. When applied to differential display analysis, pattern conferences in the amplicons are determined, particularly by a differences in the amplicons are determined, particularly by a differences in the amplicons are determined, particularly by a conganisms by species, strain or serotype, and to identify genes based on differential display. The method can also be used for genomic mapping, conganisms by species, strain or serotype, and to identify genes based on detecting changes in expression patterns, genetic linkage studies, medical diagnosis, epidemiclogy, forensics, and agriculture. The method cuse over represented sequences to prime amplification. These sequences are distributed over the entire genome, so analysis is not restricted to particular regions, and a single primer pair can amplify up to 5% of the complete Escherichia coli genome. The primers are rationally designed and the method does not require proceed to restrict to an amplify and the method does not require proceed to restrict to an amplify and the method does not require process.
  restriction enzymes or adapters. Sequences AAA14149-A14154 represent PCR primers based on over-represented octamer sequences biased to the leading strand of the E. coli K-12 genome and are fluorescently labelled at the 5' end. These primers, and lagging strand primers AAA14155- AAA14160 were used in the exemplifications of the invention to differentiate and further characterise two strains of E. coli 0157:H7 (strains FRIK 1641 and FRIK 533) and two strains from the ECOR collection (ECOR 20 and ECOR
  Detecting DNA polymorphisms, useful e.g. for identifying organisms by species, strain or serotype, comprises amplification with primers based on over-represented oligonucleotide sequences.
   50). (Updated on 15-SEP-2003 to standardise OS field)

   The present sequence is that of one of a set of oligonucleotides (see AAI70448-64) used in a mismatch discrimination experiment. The experiment compared the thermodynamic discrimination of mismatched base pairs formed by modified oligonucleotides containing 4-amino-3-(3-hydroxyprop-1-4) pynyl) pyrazolo(3,4-d) pyrimidine (HOPPPA) or 5-(3-hydroxyprop-1-ynyl)-1,3-dihydropyrimidine-2,4-dione (HOPP) versus those containing 4-amino-3-(prop-1-ynyl) pyrazolo(3,4-d) pyrimidine (PPPA) and 5-prop-1-ynyl)-1,3-dihydropyrimidine-2,4-dione (PU) at 37 degree C. Oligonucleotides containing the modified bases and also including a 3' minor groove binder (MGB), were hybridised to their complements, such as the present sequence. HOPPPA and HOPU substitution generally increased mismatch
   The invention provides modified
   oligonucleotides for mismatch discrimination. Also provides are methods for distinguishing related polynucleotides, detecting target sequences, sequencing, primer extension, for examining gene expression, and for identifying a mutation or polymorphism
  New modified oligonucleotides containing pyrazolo-pyrimidine and/or 5-substituted pyrimidine bases, useful as probes or primers in assays, especially for mismatch discrimination.

The present invention describes an isolated gene (I) obtainable by: (a) comparing the expression of one or more genes in populations of T helper (I lymphocytes (Th1)-, Th2- and T regulatory cells (Treg)-enriched cell populations to identify a gene which is differentially expressed in the populations; and (b) isolating the gene. (I) can have dermatological, antiinidnammatory, immunosuppressive, antiatractics-learchic, antiallergic, antidiabetic, neuroprotective, osteopathic, antiatrhitic and anti-ulcer activities. (I) can be used in anti-inflammatory and immunoregulatory compositions for use in therapy, prophylaxis, or diagnosis and/or in a pharmaceutical excipient, a unit dosage form or in a form suitable for local or systemic administration. Methods from the present invention can characterized for detecting Th1 and/or Th2 and/or Treg cells in a biological sample. Diseases which may be treated and/or Treg cells in a biological sample. Diseases which may be treated compositions of the invention include rheumatoria and osteoarthritis, glomerular nephritis, diabetes, inflammatory bowel disease, vascular diseases e.g. atherosclerosis and vasculitis, skin diseases such as psoriasis and dermatisis, conforders, hypersensitivity, multiple celerosis, and lung diseases e.g. chronic bronchitis, emphysema, cf or analysis of serum, urine and bolosy, particularly during and after therapy for multiple sclerosis. AAH19930 to AAH20034 and AAB75133 crepresent sequence used in the exemplification of the present invention

The present invention relates to a pharmaceutical composition comprising of a peptide ligand or its derivative, which is capable of specific binding with high affinity to vascular endothelial growth factor (VEGF) receptor-1 or its derivative and structurally similar receptors. The invention also provides peptide ligands that are capable of inhibiting angiogenesis induced by VEGF. The peptide ligands of the invention are useful for treating a disease associated with angiogenesis in a patient. They are also useful for treating angiogenesis mediated diseases e.g. They are also useful for treating angiogenesis mediated diseases e.g. of excessive or abnormal stimulation of endothelial cells e.g. Crohn's of excessive or abnormal stimulation of endothelial cells e.g. Crohn's of disease, as a birth control agent, and for treating diseases that have angiogenesis as a pathological consequence e.g. cat scratch disease and clieras, as a birth control agent, and for treating diseases associated with necvascularisation of the eye e.g. atopic keratitis and inflammatory disease, inflammatory disorders e.g. ulcerative colitis and disorders. The peptide ligands are also useful as a targeting group to improve the control agent used for therapeutic or disposition of purpose. The peptide ligands are also useful as a targeting group to improve the control.

  The invention relates to haplotyping the FK506-binding protein 8 (38kD) (FKRBP8) gene in an individual. The method involves determining the identity of the nucleotide pair at one or more polymorphic sites selected from P1 to p26 (described in the specification). The invention is useful to improve the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with FKBP8 activity, for example immunosuppression and cancer. Sequences AAI67352-403 represent oligonucleotide primers for detecting FKBP8 gene
  New haplotypes of the FK506-binding protein 8 gene, useful for genotyping that gene in individual and to design new therapy for associated disease such as immunosuppression and cancer.

   The invention relates to methods for haplotyping glycoprotein Ib (platelet) alpha polypeptide (GPIBA) gene of an individual. The method involves determining if the individual has one of the GPIBA haplotypes haplotype pairs. The methods of the invention are useful for disease diseases associated with GPIBA activity, e.g. Bernard-Soulier syndrome, platelet-type von Willebrand disease, HIV and Alzhaimer's disease. The present sequence is a primer used for detecting human GPIBA gene

   Genotyping phospholipid transfer protein gene of individual for haplotyping individual's gene, comprises determining identity of nucleotide pair at polymorphic sites for two copies of PLTP gene present in the individual.
   The present invention relates to a method for haplotyping the human phospholipid transfer protein (PLTP) gene, involving determining the identity of the mucleotide present at one or more of the 25 polymorphic sites within the gene. This can be used to aid drug development for the treatment of diseases associated with different haplotypes of the PLTP gene, possibly including atherosclerosis. The present sequence is a PCR primer used for detecting polymorphisms in the PLTP gene

  The invention relates to a human normal hepatocyte expression gene group comprising 200 genes in the human normal hepatocyte. The CDNA of each gene comprises one of 200 fully defined mucleotide sequences as given in the specification. The gene group and the cDNAs corresponding to each of the genes in the group are useful in the diagnosis and treatment of human hepatopathy. The present sequence is a cDNA corresponding to a gene expressed by normal human hepatocytes
  This sequence is a the human cholinergic receptor, muscarinic 5 (CHRMS) gene, allele specific oligonucleotide. The invention relates to a polymorphic variant of the CHRMS gene sequence. The polymorphic sequence is useful to genotype or haplotype the CHRMS gene, to predict a haplotype pair for the CHRMS gene, and for identifying an association between a trait (such as a clinical response to a drug targeting CHRMS). It is also useful in gene therapy in patients who lack the CHRMS isogene or have only one copy of it, and in assays to measure the binding affinities of one or more candidate drugs targeting CHRMS. The DNA sequence is used in the treatment of disorders affected by expression or function of a novel

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

(not The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also

described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF gene whose corresponds and affect phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell corpuring contacting a markers of phases of the cell cycle. The methods may be used as markers of phases of the cell cycle. The cycle and for identification of antifungal drugs. AAP33268 to AAP41064 crepresent SAGE tags used in the exemplification of the present invention.

AAP33262 to AAF33267 represent linkers and PCR primers used in the SAGE cycle method, in the exemplification of the present invention. ö Gaps Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonamnotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; ; 0 38.9%; Score 7.4; DB 1; Length 10; 88.9%; Pred. The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human growth hormone releasing hormone receptor (GHRHR) gene located on chromosome 7p14, and methods for haplotyping and/or genotyping the GHRHR gene. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the GHRHR gene polymorphisms. The polymorphisms are useful for the treatment of diseases associated with GHRHR activity, such as isolated growth hormone deficiency (IGHD) and pituitary adenomas.

AASI9648-AASI9673 represent primer-extension oligonucleotides for
  Genotyping human Growth hormone releasing hormone receptor gene of individual for determining haplotype of individual by determining identity of nucleotide pair at specific polymorphic sites for two copies

with CSFIR activity. Genotyping the CSFIR gene of an individual can also be used in developing diagnostic tests and therapeutic treatments. (I) is useful in studying the expression and function of CSFIR, and in expressing CSFIR protein for use in screening for candidate drugs to treat diseases related to CSFIR activity and in studying the effect of the variation on the biological activity of CSFIR. Antibodies are binding affinity of candidate drugs targeting CSFIR. Antibodies are useful in a variety of diagnostic and prognostic formats and therapeutic comethods. A transgenic animal is useful in studying expression of the CSFIR isogenes in vivo, for in vivo screening and testing of drugs targeted against CSFIR protein, and for testing the efficacy of therapeutic agents and compounds. Allele specific oligonucleotides (ASO) are useful as probes and primers, and for assaying a polymorphism in the target region. Without requiring any a priori knowledge of the phenotypic of any particular CSFIR or haplotype the invention provides a method for identifying lead compounds that are more likely to show efficacy in clinical trials. This sequence is a primer used to detect the control of the property of the control of control highest expression among the genes expressed in human maturation, activation DC. Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnossis of various human diseases related to human DC. ABL42627 to ABL42926 represent specifically claimed human maturation/activation DC expression gene tags from the present invention present invention describes a human maturation/activation dendritic [ (DC) expression gene group consisting of 100 genes which show the Gaps Human maturation/activation dendritic cell expression gene tag #10. The present invention relates to a polynucleotide comprising a sequence which comprises adenosine A2a receptor (ADORA2A) isogene chosen from 18 seagenes 1-2 and 4 having polymorphisms at polymorphic sites (PS) corresponding to nucleotide position 531 (PS1) of a sequence of 937 bp, 1345 (PS2), 1794 (PS3) and 1833 (PS4) of a sequence of 1906 bp, or which capture of a polymorphic variant of a coding sequence for ADORA2A is useful for ADORA2A gene is located on chromosome 22411.23. ADORA2A is useful for screening for drugs targetting the polymorphic oratiant with a candidate agent and assaying for binding cativity. The polymorphism and haplotype data are useful for validating whether ADORA2A is suitable target for drugs to treat cellular stress and hypertension, screening for such drugs and reducing bias in clinical trials of such drugs. A polymorphic variant of ADORA2A is useful in catudying the effect of the variation on the biological activity of ADORA2A, on the binding affinitivy of candidate drugs targetting ADORA2A (concluding affinities of one or more candidate drugs targetting concluding affinities of one or more candidate drugs targetting concluding affinities of one or more candidate drugs targetting concluding and an another and another

   The present invention relates to a new polynucleotide comprising a nucleotide sequence which comprises lipase, hormone sensitive (LIPE) isogenes. The invention is useful in screening for drugs targeting LIPE isogenes that are useful for tracting obseity and male sterility. The invention are useful for improving the efficiency and creliability of several steps in the discovery and development of drugs of for treating diseases associated with LIPE activity. The polynucleotide is useful in studying the expression and function of LIPE, and in expressing LIPE protein for use in screening for candidate drugs to treat cliented to LIPE activity. It is also useful in studying the effect of the variation on the biological activity of LIPE as well as on the binding affinity of candidate drugs targeting LIPE for the treatment of obseity and male sterility. The invention is useful for studying the carpression of LIPE isogenes in vivo, for in vivo screening and testing of drugs targeted against LIPE protein, and for testing the efficacy of therapeutic against LIPE protein, and for testing the efficacy of therapeutic against LIPE protein, and for testing the efficacy of therapeutic against LIPE protein, and for testing the efficacy of therapeutic against LIPE protein, and for testing the efficacy of therapeutic against LIPE protein, and for testing the efficacy of therapeutic against LIPE present nucleic acid sequence represents one of a collection (ABK96026-ABK96081) of oligonucleotide primers that were used in the invention to detect polymorphisms in the human LIPE gene

The invention comprises DNA, cDNA and protein sequences of the human electron-transfer flavoprotein, beta polypeptide (ETFB) gene (located on chromosome 19913.3-13.7). The invention specifically relates to the carbonomesome 19913.3-13.4). The invention specifically relates to the identification of 27 novel polymorphic sites within the ETFB gene. Identification of 27 novel polymorphic sites within the ETFB gene.

Electron-transfer flavoprotein (ETF) is an obligatory electron acceptor of cr nine primary flavoprotein (ETFP) is an obligatory electron acceptor mitochondrial matrix. ETF is composed of an alpha (ETFR) and a beta creament of ETFB subunit. Electrons accepted by ETF are transferred to the mitochondrial respiratory chain by ETF dehydrogenases (ETFDHs).

CC EFF or ETFDH leads to glutaric acidaemia type II (GAII). Therefore ETFB is a pharmacceutically-important gene in the treatment of GAII. The novel ETFB polymorphisms identified in the invention are useful for genotyping and haplotyping the ETFB gene of an individual. The ETFB protein and nucleic acids of the invention are useful for testing the efficacy of therapeutic agents and compounds for glutaric acidaemia type II. The nucleic acids of the compounds for glutaric acidaemia type II. The nucleic acids of the invention are useful in the production of a transgenic animal expressing the ETFB gene. Nucleic acids ABL39414-ABL39440 represent claimed ETFB allele-specific probes. Nucleic acids ABL39414-ABL39440 represent claimed claimed

The invention relates to genotyping a human UDP glycosyltransferase (UGT1A1) gene of an individual, involving determining for the two copies of the UGT1A1 gene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites. The new method is useful for determining whether an individual has a haplotype or haplotype pairs, given in the specification. It is useful for improving the efficacy and reliability of several steps in the discovery and catalogists for treating disease associated with UGT1A1 as a candidate agent for treating a specific condition or disease predicted to be associated with UGT1A1 activity. The design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with UGT1A1 activity. The method is useful to screen for compounds targeting UGT1A1 to treat a specific condition or disease associated with UGT1A1 activity. An uncleic condition or disease associated with UGT1A1 activity. An uncleic specific condition or disease associated with UGT1A1 activity. An uncleic condition or disease associated with UGT1A1 activity. An uncleic condition or disease associated with UGT1A1 activity. An uncleic condition or disease associated with UGT1A1 activity. An uncleic condition or disease associated with UGT1A1 activity. An uncleic condition or disease associated with UGT1A1 activity. An uncleic condition or disease associated with UGT1A1 activity. On (II) or (II) is useful for studying the activity. (I) or (II) is useful for treat diseases related to UGT1A1 accombinant organism comprising (II) is useful for tstudying expression of the UGT1A1 isogenes in vivo, for in vivo screening and testing of drugs targeted against UGT1A1 protein, and for testing the Gitcapetic defined compounds for ceiting the Efficacy of the Targeted against organism compusing (II) is useful for testing the UGT1A1 isogenes in a biological system. Ass99134-AAS99203 represent UDP method of the invanicy.

The invention relates to SAGE (serial analysis of gene expression) tags
representing groups of genes which are differentially expressed in human
control hepatitis C (CH) liver tissue or hepatitis C-induced
chronic hepatitis C (CH) liver tissue or hepatitis C-induced
chronic beautistis C (CH) liver tissue or hepatitis C clinduced
chapatocollular carcinoma (HCC) compared with normal human liver tissue.

The SAGE tags of this invention compist of a sequence of 10 nucleotides
concated downstream of the 5'-CANG-3' sequence motif lying nearest to the
polya region of CDNAs derived from a variety of genes These tags serve
couniquely identify each transcript and can thus be used to analyse the
pattern of gene expression in particular cell types. The invention also
crelates to proteins encoded by the genes expressed in chronic hepatitis C
liver tissue or HCC, antibodies against these proteins, and inhibitors of
the expression of groups of genes that are overexpressed in chronic
cc hepatitis C liver tissue or HCC groups of genes differentially expressed
cn chronic hepatitis C tissue or HCC may be used for the diagnosis and
creatment of these diseases. Such genes, inhibitors of thair expression
cc activity, and antibodies against the gene products may be used in the
development of drugs to treat chronic hepatitis C and/or HCC. Sequences
ABV84791-ABV84890 are SAGE tags representing 100 genes which are highly
cc expressed in chronic hepatitis C liver tissue

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are differentially expressed in human chronic hepaticis C (TH) liver tissue or hepaticis C. induced to chronic hepaticis C (TH) liver tissue or hepaticis C (TH) liver tissue or LOATG-3' sequence motif lying nearest to the coated downstream of the 5'-CATG-3' sequence motif lying nearest to the C DATG-3' sequence motif lying nearest to the copy a region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the CC pattern of gene expression in particular cell types. The invention also crelates to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of hepatitis C liver tissue or HCC groups of genes that are overexpressed in chronic hepatitis C tissue or HCC may be used for the diagnosis and chronic hepatitis C tissue or HCC may be used for the diagnosis and correct of these diseases. Such genes, inhibitors of their expression or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C drugs to treat chronic development of drugs to treat chronic hepatitis C drugs representing 100 genes which are highly

   The present invention relates to a nucleic acid library comprising myc-dependent downstream genes or their functional fragments essentially capable of supporting a neoplastic character of cancer such as growth, invasion or spread. These myc target or tag sequences are identified by SAGE (serial analysis of gene expression). The library is useful to find new diagnoses and treatments for cancer. The invention is also useful to enhance production of recombinant proteins in a production system with high expression of endogenous or transfected myc oncogenes. ABK23412-ABK23828 represent transcript tag DNA sequences that are activated or

The invention relates to a multidimensional library (MDL) for screening molecules that potentially interact with a target molecule. A MDL may be compensed to a reflicial polymeric compounds concluding oligonuclocides, proteins, polymeptides, peptides, poptides, polycarbohydrates etc., where the library comprises at least one molecule comprising a general formula (XYN) m, where: (XYN) is a repeating unit of the at least one molecule; X = a functional unit that interacts with the target molecule; Y = a structural unit; n = the number of the structural units in the repeating unit; and m = a number of repeating units in the cat least one molecule. The MDL is useful for screening molecules that cotentially interact with a target molecule, particularly for screening potentially interact with a target molecule. The multidimensional peptide products can caffinity for target molecule. The multidimensional peptide products can be used in any industrial or pharmaceutical application that uses a fifinity for target molecule. The multidimensional peptide products can be used in any industrial or pharmaceutical applications in the fields of cuseful in a wide variety of in vivo applications in the fields of cuseful in a wide variety of in vivo applications in the fields of administration of multidimensional peptides (WDP) and MDP compositions as immunogens for vaccines, which useful for active immunisation procedures. The Present sequence is that of an oligonucleotide useful in the

   The present invention describes a polypeptide (I) which is a polymorphic variant (PV) of the acetyl-Coenzyme A acyltransferase (peroxisomal 3-oxoacyl-Coenzyme A thiolase) ACAAl protein (ABB05516). ACAAl is located on chromosome 3p23-p22. (I) can be encoded by ABA92286 (or ABA93286) on chromosome 3p23-p22. (I) can be encoded by ABA93286 (or ABA93280) one of the haplotype shown in Table 4 or one of the haplotypes shown in Table 4 or given in the specification. The polymorleotide encoding ACAAl can be used for providing haplotype and genotype information of an individual. Furthermore, the polymorleotide is useful for the treatment of disorders related to its abnormal expression or function. ABA93289 to ABA93383 represent allele specific oligonucleotides (ASOS) which are used in the
The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human Ran GTPase activating protein 1 (RANGAP1) gene located on chromosome 20413.24, and methods for haplotyping and/or genotyping the RANGAP1 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or primer-extension oligonucleotides for detecting the RANGAP1 gene polymorphisms. The polymucleotides and screened compounds are useful for treatment of diseases associated with RANGAP1 activity, such as cancer and other disorders associated with an irregular cell cycle. The invention relates to single nucleotide polymorphisms in the gene encoding the human caspase 5, apoptosis-related cysteine protease (CASP5) perfected. A method for haplotyping the CASP5 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the CASP5 haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype or haplotype or haplotype pair in a population exhibiting the trait with the haplotype or haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in a reference coppulation, where a higher haplotype frequency in the trait is associated with the haplotype or haplotype pair. CASP5 and its corresponding DNA are used for studying the expression and function of CASP5, for use in screening for candidate drugs to treat chiseases related to CASP5 activity, such as cancer (e.g. hereditary compolyposis colorectal cancer, gastrointestinal tumours and endometrial tumours). Sequences ABK81520-ABK81559 represent allele-specific oligonucleotide PCR primers used to detect CASP5 gene polymorphisms

The patent discloses novel genetic variants of the arylalkylamine Nacetyltransferase (AANAT) gene. The invention also relates to compositions and methods for haplotyping and/or genetyping the AANAT compositions and methods for haplotyping and/or genetyping the AANAT gene. Polymorphic variants of AANAT protein are useful for screening for drugs targeting the polypeptide. AANAT protein are useful for screening for candidate drugs to treat diseases related to AANAT activity. The methods are used to develop diagnostic tests and therapeutic treatment for disorders of pineal gland that derive from defects in melatonin synthesis. It is useful for determining whether an individual has one of the haplotypes 1-4 or the haplotype pairs. The haplotyping method is useful to validate AANAT as a candidate target for treating a specific condition or disease predicted to be associated with AANAT activity. AANAT sequences of the invention are also used in gene therapy and antisense therapy. The present DNA sequence is a primer which is used for detecting human AANAT gene polymorphisms

The invention describes an isolated nucleic acid regulatory sequence for a cyclin D1 promoter, a CD40L promoter, vancomycin-resistant enterococci (VRE) promoter, and TBV promoter, and TBV promoter, and TBV promoter, thuman epidermal growth factor receptor 2 (HER2) promoter, or a beta lactamase (Bla) promoter. Transcription requlatory sequences may be used to regulate expression of the endogenous, autologous or heterologous genes operably linked to the promoter, and may be incorporated into cheterologous nucleic acid constructs for use in regulated expression of transgenes. Regulated expression of cyclin D1 can be used in cancer theraptes, such as breast, colon or pancreatic cancers and familial adenomatous polyposis. Regulation of the activity of CD40L gene promoter may be used in the treatment of immunological disorders, such as autoimmune diseases e.g. multiple sclerosis (MS), systematic lupus arthritis. Regulated expression of genes under the control of the HBV (hepatitis B)-specific core, pre-S and X promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the hardren of the promoters can be used in the prom

   The invention and protein sequences. Specifically, the invention relates to the discovery of 22 novel polymorphic sites within the APC2 gene. The invention also comprises methods for haplotyping and genotyping the APC2 gene in an individual. The APC2 gene (located on chromosome 11) encodes a lysosomal-specific enzyme that catalyses the hydrolysis of orthophosphoric monoesters to alcohol and phosphate. The ACP2 gene and protein are pharmaceutically important in the treatment of Hodgkin's clisases (HD) and acid phosphatase deficiency. The novel ACP2 gene. Co polymorphisms of the invention are useful in haplotyping the ACP2 gene. Co polymorphisms of the invention are useful in validating ACP2 as a target (and designing drugs) for treating an ACP2-related disease or condition (e.g. Hodgkin's disease and acid phosphatase deficiency). The ACP2 gene polymorphisms are useful for ACP2 genotyping, which can also be used to develop diagnostic tests and therapeutic treatments. The ACP2 protein and nucleic acids of the invention are useful in the production of a transgenic animal which expresses ACP2 protein. The ACP2 nucleic acids of the invention are useful in the production of a transgenic animal which expresses ACP2 protein. The ACP2 protein and nucleic acids ABL36320 represent claimed ACP2 allele-specific probes. Nucleic acids ABL36321-CC ABL36354 represent claimed ACP2 allele-specific PCR primer-extension

The invention relates to an isolated polynucleotide comprising a sequence selected from a polymorphic variant of calmodulin 1 (CALM1). The polymorphic variant comprises an CALM1 isogene defined by a haplotype selected from haplotypes 1-21 given in the specification. The polymorphisms are useful for studying this protein for the treatment of a disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting CAMM1 to treat a specific condition or disease predicted to be associated with CALM1 activity. Establishing CALM1 haplotype or haplotype pair of an individual is useful for improving the efficiency and related with CALM1 activity. Stablishing CALM1 haplotype or haplotype pair of an individual is useful for improving the efficiency and relability of several steps in the discovery and development of drugs cor treating diseases associated with SCYA3 activity, e.g. Alzheimer's disease and diseases associated with SCYA3 activity, e.g. Alzheimer's condition or disease proceed the associated with CALM1 gene in an individual is also useful specific condition or disease thuman CALM1 allele- specific activity. The present invention relates to a new cholinergic receptor, muscarinic 5 (CHRM5) polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRM5 gene or its fragment, or a polymorphic variant of a reference sequence for a CHRM5 cDNA or its fragment. The invention is useful in Grug screening assays. The molecules of the invention are useful in studying the expression and function of CHRM5, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the invention are useful in developing diagnostic tests and therapeutic reatments. The method is also useful in the design of clinical trials of candidate drugs for treating specific condition or disease associated with CHRM5 activity and is useful in determining whether an individual a disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting CALMI to treat a specific condition or disease predicted to be associated with CALMI activity. Establishing CALMI haplotype or haplotype pair of an individual is useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with SCYA3 activity, e.g. Alzheimer's disease and diseases involving defects in calcium-dependent signal transduction.    The invention describes a polypeptide capable of crossing the small intestine or blood brain barrier. The polypeptide is used to treat a disease associated with central nervous system pathologies. This sequence represents an oligonucleotide used in the creation of a phage capable of producing peptide that can deliver a biological agent across the small intestine or blood brain barrier.
  edaphic; bacterial biomass; aqueous soil suspension; biofilm; fertilizer; bacterisation; soil; agricultural waste; cereal; maize; primer; ss.
  New peptides capable of crossing the small intestine or blood brain
barrier are useful as a ligand to increase bioavailability in the
treatment of disease associated with central nervous system pathologies.
  The invention relates to the novel method for production of edaphic bacterial biomasses. The method comprises contacting an aqueous soil suspension with a substrate to form a biofilm, maturing the biofilm to allow dominant strains to migrate into the supernatant liquid, and recovering and culturing the most prolific strains in liquid media. The biomasses can be used as a fertilizer. The biomasses are useful for
   Production of bacterial biomasses useful for bacterization of soil and agricultural waste comprises contacting soil suspension with substrate, maturing biofilm and recovering and culturing most prolific strains.

   The present invention relates to the use of a natriuretic peptide (atrial natriuretic peptide, ANP or brain natriuretic peptide, BNP) in combination with a growth protein, e.g. Short Stature Homeobox-containing gene (SHOX) protein for the preparation of pharmaceutical compositions for the treatment of short stature in a subject being suspected of having a genetic defect in the SHOX gene or for treatment of patients with cardiovascular diseases. The natriuretic peptide (ANP or BNP) in combination with a growth protein, e.g. SHOX protein is useful for the preparation of pharmaceutical compositions for the treatment of short stature in a subject being suspected of having a genetic defect in the SHOX gene or for treatment of patients with cardiovascular diseases. It is also useful for the preparation of pharmaceutical compositions for simulating or increasing human growth or for treating patients with idiopathic short stature, patients with Turner syndrome, or patients with Leri-Weill syndrome. The present sequence is a SHOX DNA binding site used in the exemplification of the invention.

The present invention relates to a method for preparing a composition for inhibiting recruitment of perivascular cells of smooth muscle type using a VE statin protein (I; ADR27861-ADR2783 and ADR27902). WE-statins, soluble factors secreted by endothelial cells of the blood vessels, block recruitment of perivascular smooth muscle cells (but do not affect their proliferation), so inhibit angiogenesis. WE-statins, also their peptide fragments, nucleic acids encoding them and vectors containing this nucleic acid, are used for treating cancer, retinopathy, atherosclerosis and restenosis, including in gene therapy. The VE-statin nucleic acids can also be used to produce transgenic animals (for studying the VE-statin proteins and genes); the VE-statins are used to screen for specific (ant)agonists, and antibodies specific for VE-statins can be used to determine expression profiles, particularly for diagnosis of

predisposed to schizophrenia, involving providing a nucleic acid from a human subject, where the nucleic acid comprises an alpha7 allele, detecting the presence of a polymorphism within the alpha7 allele, and correlating the presence of the polymorphism with a predisposition to schizophrenia. Also described are: a kit for determining if a subject is predisposed to schizophrenia, comprising a reagent suitable for use in specifically detecting whether a subject is predisposed to specifically detecting whether a subject is predisposed to instructions for determining whether a subject is predisposed to schizophrenia; and screening (M2) compounds, involving providing a cell comprising an alpha7 allele with the polymorphism, and detecting a change in alpha7 expression in the cell in the presence of the test compound relative to the absence of the test compound relative to the absence of the test compound. (M1) is useful for identifying individuals predisposed to schizophrenia. This sequence represents an exon-intron boundary sequence of the human alpha 7 nicotinic ACh receptor (CHRNA7) DNA.
  Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.
  Gaps
nucleic acid comprising alpha7 allele from subject, detecting polymorphism within alpha7 allele, and correlating polymorphism with predisposition to schizophrenia.

The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin.8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing used in the method of the invention.

  The invention relates to a method of diagnosis (MI) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin-8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
  Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.

The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.

The invention describes a method of elucidating (M1) a protein expression profile of a test cell line or group of cells. The method involves candomly introducing into the genome of a cell or group of cells a promoterless polynucleotide construct (I), comprising in a 5'-3' orientation: a splice acceptor consensus sequence, a complementary consensus sequence of a first type IIS restriction enzyme recognition sequence, an oligonucleotide sequence, where the promoteries polynucleotide sequence of a second type IIS restriction enzyme recognition sequence, and oligonucleotide sequence, where the promoteries polynucleotide construct when introduced into an actively expressed gene results in the generation of a fusion protein, containing the assayable marker peptide inserted at a random position within two exons coding for the cellular protein cells are neceded by the gene, identifying those cells expressing the marker peptide fused to the cellular protein, and determining the identity of the proteins to which the marker peptide is fused in each group of cells. Also described are: identifying (M2) differentially expressed proteins in two different populations of cells, and identifying (M3) protein/protein interactions. (M1) is useful for elucidating a protein expression profile of expressed proteins in two different populations of cells indentifying of cells. (M1) and (M2) are useful for screening small molecule drugs, which involves generating
   Elucidating protein expression profile of test cell line, by randomly introducing promoterless polynuclectide construct into genome of cells, identifying cells expressing marker peptide fused to protein and determining proceins.

   This is a degenerate RT-PCR primer used in combination with a 3' poly(T) primer (AAV09225-V09236) for the amplification of the inducible vyrochrome P450Ral gene which specifically metabolises a derivative of the retinoic acid (RA). The cytochrome P450 gene in general produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nuclectide sequence can be used to induce or suppress the expression of its protein. P450RAl is highly induced by RA in cell lines and tissues. This allows for development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing the catabolism of RA
  Identifying DNA encoding inducible or suppressible cytochrome P450 - by screening for drugs which reduce the catabolism of retinoic acid, useful in cancer chemotherapy and the treatment of acne and psoriasis.

New strains of Agaricus bisporus with improved cap whiteness - compared with the UI strain but retaining other desirable features of this strain.
  The sequence is that of an RAPD (random amplified DNA) primer which was used in the isolation of an Agaricus bisporus mushroom strain which has whiter caps, less scaling than known strains, particularly for mushrooms produced in the first break, so it is more valuable (suitable for marketing fresh rather than canning). It also retains the desirable characteristics (good cap shape and shelf life, thick stem and veil) of

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual from normal cells. The method involves the cells from the same individual (cf with oligonucleotide primers selected from adenine and guanine and x = 3-7, (ii) a nucleotide sequence (CG)xRX, where R is as in (i) and Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iv) a nucleotide sequence (CG)xXY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CA)xXY, where R is a purine selected from adenine and guanine and x = 6-16, (vi) a nucleotide sequence (CA)xXY, where R is a purine selected from cytosine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xXY, where R is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xXY, where R is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xXY, where X is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xXY, where Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xXY, where Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xXY, where Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, und (ix) a combination cof the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
   ö
                       efficient feed converters and fatter than other types. The assay comprises analysing a tissue sample to determine if the genotype comprises the allele, and genetic features typical of animals with Duroctype MFC are present. The method is used to select animals that have Duroc characteristics for use in breeding programmes (to develop the animals with Duroc pig characteristics), and to assess meat quality
meat of superior quality (particularly tenderness) but are normally less

  Sequences 228321-228360 are polynucleotides isolated from primary squamous cell lung cancers of two patients. These sequences represent a profile of gene expression patterns in lung cancer. Sequences 228321-228360 correspond to previously characterised genes. Sequences 228341-228360 do not correspond to known genes, although some do correspond to reported Expressed Sequence Tags (ESTS). This sequence does correspond to not correspond to RAN142). The presence of these polynucleotide sequences in lung cells is indicative of lung cancer. The sequences can be used to generate antibodies for the detection of tumour cells. Detection of the overexpression of the polynucleotides and their gene products can be used in the diagnosis of lung cancer or the sequences can also be used to screen for agents potentially useful for treating lung cancer and to generate transgenic animals (for studying gene function and for drug screening)

AAZ61437-52 represent random amplified polymorphic DNA (RAPD) primers which were used for genetic mapping and cloning of the Pa-ti disease resistance region of fice. The rice Pi-ta gene was cloned by a map-based cloning strategy. The Pi-ta protein has a novel structure, compared to all known classes of resistance gene products. The polynucleotide sequence confers a Pi-ta resistance gene-mediated defence response against diseases caused by fungal pathogens, particularly the rice blast fungus. Introduction of the cloned Pi-ta gene into susceptible rice confers resistance to pathogen strains
   Novel nucleic acid fragments conferring Pi-ta resistance gene-mediated defense response for producing transgenic plants resistant to fungal pathogens, especially rice blast fungus.

   ö
expressed genes, or of their encoded proteins, can be used to identify cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation of condogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells

Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory coffactor proteins which are preferentially or differentially expressed in monocyted dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown genes or ESTS (expressed sequence tags) which were previously unknown genes or ESTS (expressed sequence tags) which were previously unknown to be cother transcripts correspond to novel genes. Antigen-presenting cells other transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated costimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Immunostimulatory coffactors also being required for insufficient activation of cytotoxic I-lymphocytes (CLB). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for against the modulate expression of differentially expressed genes in APC; and as hybridisation probes / amplification primers for the diagnosis and monitoring of diseases related to abnormal companies of these genes. Detection of the dendritic cell differentially cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunofherapy (or to stimulate production of a production of them are used in gene therapy. Co-administration of tumour antigens and monitoring of containing these genes complex or administration of tumour antigens and monitoring of APC-associated costimulatory factors enumes antigens and successing them are used in gene therapy. Co-administration of tumour antigens and monitoring and monitoring of thems are used in gene therapy.
  ö
   APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells

   The present invention is concerned with a method of differential display of prokaryotic mRNA by RT-PCR. This involves the amplification of the mRNA once, and the further amplification of the cDNA, rather than the repeated amplification of the mRNA sample. It also eliminates the need for sequencing gels, using Northern and total RNA dot blots to confirm differentially displayed transcript levels. The primers AAA99869-A99868 were used in a reverse transcription PCR amplification, and primers AAA99669-A99876 were used to prepare probes for a Northern blot analysis. The method can be used to crapidly identify genes with increased or decreased transcription following environmental stimuli, in bioprocess fermentations, and to analyse gene regulation. (Updated on 06-AUG-2003 to
  Performing differential display of prokaryotic mRNA by a RT (reverse transcriptase)/RAP (random arbitary-primed) PCR based technique comprises using a unique combination of random primers in a single amplification

   Identifying one or more sequences of a target nucleic acid (NA), useful for parallel analyses, comprises contacting the NA with a set of pools of probes comprising mixture of probes with different information regions.
  The present sequence is a probe used to demonstrate the method of the invention, which is concerned with the use of pools of probes to enable sequencing by hybridisation, a process known as SBH. Overlapping probes are used which allows the identification of sequences longer then the probe length, and either the target nucleic acid or the probe is labelled. The method of the invention is useful for assembling sequences

The invention relates to the isolation of novel strains of bacteria (Bacillus pumilus B3 (CECT 5105) and B. licheniformis B12 (CECT 5106)) which produce glibberellin plant hormones that regulate plant growth. The plant growth hormones are produced at level of 0.0029-0.148 mg/l by B3 and at 0.0017-0.123 mg/l by B12, after 24 hour culture at 28 deg. C in liquid medium. The new strains are used to treat cultured plants (both woody and herbaccous) to increase their growth, vigour and disease resistance. Primers AAA70755-A70762 were used to PCR amplify DNA from the B. pumilus strain B3

   Sequences AASO4414-AASO4451 represent primer-extension oligonucleotides specific for a DNA encoding human death-associated protein 6 (DAXX). This DNA may comprise one or more polymorphisms at specific nucleotide positions to form one of nineteen possible polymorphic variants.

Associations between a trait and a genotype or a haplotype of the DAXX gene can be identified by comparing the frequency of the genotype or chaplotype in a population exhibiting the trait with that of a reference population. A higher frequency in the trait population indicates an association. Methods involving genotyping or haplotype pairs for the DAXX gene of an individual can lead to prediction of haplotype pairs for the DAXX gene of related individuals, and may be useful in studying the expression of LAXX, as well as in developing drugs targeting this protein. Polymorphic variants of DAXX are useful in studying the effect of the variation on the biological activity of DAXX as well as on the biological activity of DAXX as well as on the biological activity of DAXX as well as on the biological chaps targeting backering, forenaic applications, and for identifying is also useful for studying population diversity, anthropological lineage, associations between the DAXX genetic variation and a trait such as level of measure binding affinities of one or more candidate drugs targeting the baxx protein

  The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
  New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular

The invention relates to genotyping/haplotyping the cholinergic receptor, nicotinic, beta-polypeptide 2 (neuronal) (CHRNB2) gene of an individual, comprising determining for the two copies of the CHRNB2 gene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites selected from PS1-24. Also include are oligonucleotides for performing the method and the nucleotide sequence of the polymorphic variants of CHRNB2. The method is useful for detecting novel CHRNB2 comprising the method is useful for detecting novel CHRNB2 or polymorphisms and for determining if an individual has a haplotype or sponsor of the specific condition or disease predicted to be associated with CHRNB2 activity (e.g. a memory disorder, Alzheimer's candidate agent for treating a specific condition or disease predicted to defease, epilepsy, a learning disorder, schizophrenia, attention deficit/hyperactivity disorder, (ADMD) and autosomal dominant nocturnal frontal lobe epilepsy (ADNFLE)), and in the design of clinical trials of candidate drugs for treating a specific conditions or disease predicted to be associated with CHRNB2 activity. The method is useful to screen for compounds targeting CHRNB2 to treat a specific conditions or disease consisted with CHRNB2 activity. The polymorphic nucleic acids are useful in studying the expression and function of CHRNB2, and in expressing CHRNB2 gene is located on chromosome lg21. The present sequence is an allele specific oligonucleotide (ASO) PCR primer (3' terminus) for performing the method of the invention

   acid composition of seeds. The method comprises: (1) closing process, the phosphoency ruste carboxylase (PEP) or acetyl-CoA carboxylase (ACC) genes or their fragments; (2) constructing the corresponding antisense gene of anti-PEP or anti-ACC; and (3) introducing the antisense gene into the plant cell of a crop. The method is applicable in plant breeding to give oilseed crops with high oil or protein content like soya bean, sunflower, rapessed, peanut and sesame. The produced crop plants have high yield of oil or protein. The present sequence represents an oligonucleotide which is used in the construction of an anti-PEP gene in an example from the present invention
   The invention relates to a human normal hepatocyte expression gene group comprising 200 genes in the human normal hepatocyte. The CDNA of each gene comprises one of 200 fully defined nucleotide sequences as given in the specification. The gene group and the cDNAs corresponding to each of the genes in the group are useful in the diagnosis and treatment of human hepatopathy. The present sequence is a cDNA corresponding to a gene expressed by normal human hepatocytes
  present invention describes a method for altering the protein/fatty
   Altering protein/fatty acid composition of seeds, useful for producing e.g. soya bean or sesame seed with high protein/fatty acid content, comprises introducing antisense gene.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Claim 1; Page 24; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and GZ/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression

comprising contacting human DNA with a probe which comprises at least 10 contiguous nuclectides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF gene whose expression is affected by the class of frugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF4064 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention. 888888888888888888888888888888888

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 243; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and  $\rm GZ/M$ ; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression

   The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human pnas which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORP gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. App33268 to AAP44064 represent SAGE tags used in the exemplatication of the present invention.

The invention relates to genetic variants of human oncostatin M (OSM) gene. The invention also relates to compositions and methods for haplotying and/or genotyping OSM gene in an individual. Polymucleotides of the invention are useful in studying the expression and function of OSM, and in expressing OSM protein for use in screening candidate drugs to treat diseases related to OSM activity. They are also useful for therapeutic purposes. Methods of the invention are useful for determining whether an individual has a haplotype or haplotype pairs. The method is also useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with OSM activity, e.g. cancer, diseases involving lung inflammation and rheumatoid arthritis. The present sequence is a primer

   The invention relates to genetic variants of human G-protein coupled receptor 31 (GPR31) gene. The invention also relates to compositions and methods for haplotyping and/or genotyping the GPR31 gene in a individual. Polynucleotides of the invention are useful in studying the expression and function of GPR31, and in expressing GPR31 protein for use in screening candidate drugs to treat diseases related to GPR31 activity of GPR31 as well as on the binding affinity of candidate drugs targetting GPR31 for the treatment of cancer. They are also used in gene therapy. The haplotyping method is useful for improving the efficiency and relability of several steps in the discovery and development of drugs for treating diseases associated with GPR31 gent in an individual, which can also be used by the pharmaceutical research scientist to validate candidate target for, and in design of clinical trials of candidate drugs, for treating a specific condition drugs or disease principle of the present sequence is a predictive of the present sequence is a

The invention describes a novel isolated polynucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for colony stimulating factor I receptor (CSFIR) gene, found on The colony stimulating factor I receptor (CSFIR) gene, found on The colony stimulating factor I receptor (CSFIR as a candidate target or an inflammatory disorders and the haplotypes can be used to validate CSFIR as a candidate target for treating a specific condition or disease predicted to be associated with CSFIR activity. Genotyping the CSFIR gene of an individual can also to be used in developing the CSFIR gene of an individual can also useful in studying the expression and function of CSFIR, and in expressing CSFIR protein for use in screening for candidate drugs to the variation on the biological activity of CSFIR. Antibodies are binding affinity of candidate drugs targeting CSFIR. Antibodies are cuseful in a variety of diagnostic and prognostic formats and therapeutic methods. A transgenic animal is useful in studying expression of the CSFIR isospenes in vivo, for in vivo screening and testing of drugs corrected against CSFIR protein, and for testing the efficacy of targeted against CSFIR protein, and for testing the efficacy of target region. Without requiring any a priori knowledge of the phenotypic correct fany particular CSFIR or herapeutic and prognostic the invention provides a merce of any particular CSFIR or herapeut in the invention provides a merce likely to show

The present invention describes a zinc finger protein (I) that binds target site, comprising a first (F1), a second (F2), and a third (F3)

```
The present invention describes a method for haplotyping the serine/threonine kinase 11 (Peutz-Jeghers syndrome) (STK11) gene of an individual. STK11 gene sequences can be used in gene therapy. The STK11 gene is useful for screening drug targeting comprising contacting STK11 gene is useful for screening drug targeting comprising contacting STK11 with a candidate agent and assaying for binding activity. STK11 is useful for improving the efficiency and reliability of several steps in the circuity and development of drugs for treating diseases associated with STK11 activity, e.g. Peutz-Jeghers syndrome. The method is useful for haplotyping the STK11 gene in an individual, which can also be used in pharmaceutical research to validate STK11 as a candidate target for, and in design of clinical trials of candidate drugs for, treating a specific condition drugs or disease predicted to be associated with STK11 cartivity. Allele-specific oligonucleotides (ASOS) are useful as probes and primers for assaying a polymorphism in the target region. The present sequence represents a primer used for detecting STK11 gene polymorphisms,
  ö
function of CFL1 and expressing CFL1 protein for use in screening for candidate drugs to treat diseases related to CFL1 activity. The polymorphism and haplotype data are useful for validating whether CFL1 is a suitable target for drugs to treat immunological disorders, screening for such drugs and reducing bias in clinical trials of such drugs. The present sequence represents one of a set of primer extension oligonucleotide PCR primers used in the invention to detect polymorphisms

   The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are expressed in activated human Th1 and/or Th2 cells. The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif ying nearest to the polya region of cDNas derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes capressed in Th1 and/or Th2 cells, antibodies against these proteins, and inhibitors of the expression of groups of genes tage sexpressed in either or both the two cell types. Groups of genes expressed in Th1 and/or Th2 cells types may be used for the diagnosis and treatment of Th1 and Th2-related disorders. Sequences ABV78610 are SAGE tags representing 50 genes which are more highly expressed in Th2 cells compared with Th1 cells

The invention relates to an isolated polynucleotide comprising a sequence selected from a polymorphic variant of calmodulin 1 (CALM1). The polymorphic variant comprises an CALM1 isogene defined by a haplotype

polymorphic variants may also be used in screening for compounds targeting CALMI to treat a specific condition or disease predited to be associated with CALMI activity. Establishing CALMI haplotype or haplotype pair of an individual is useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with SCYAN activity, e.g. Alzheimer's disease and diseases involving defects in calcium-dependent signal transduction. Haplotyping the CALMI gene in an individual is also useful in the deabign of Linical trials of candidate frugs for treating a specific condition or disease predicted to be associated with CALMI activity. AAS;58018 represent human CALMI allele- specific This invention relates to novel genetic markers and variants of the gene encoding the cholinergic receptor, nicotinic, gamma polypeptide (CHRNG), located on chromosome 2431-p34. Specifically, it refers to a set of haplotypes in the CHRNG gene, which are useful for improving the efficiency and output of the drug discovery process by the identification of drugs that can target the CHRNG protein and treat discorders associated with its abnormal expression or function. The CHRNG protein is the gamma subunit of the acetylcholine receptor (ACHN), and autoantibodies directed selected from haplotypes 1-21 given in the specification. The bologival function of CALM1 at golymorphisms are useful for studying the biological function of CALM1 at well as in identifying drugs targeting this protein for the treatment of a disorder related to its abnormal expression or function.    The present invention describes a library comprising polypeptides. Bach polypeptide comprises a first or second zinc finger domain. The domains of each polypeptide are identical to a zinc finger domain from a naturally occurring protein and either do not occur in the same naturally occurring protein or occur in the same naturally occurring protein or occur in the same naturally occurring protein in a different configuration than in the polypeptide. The domains vary among polypeptides. Also described: (1) producing chimeric nucleic acids; (2) generating an artificial zinc finger polypeptide that specifically binds to a target DNA site; and (3) identifying a nucleic acid encoding a zinc linger polypeptide that specifically recognises a target DNA site. The library can be used for producing chimeric nucleic acids. ACC41551 to ACC41788 and ABR40919 to ABR41015 represent nucleotide and amino acid sequences given in the exemplification of the present invention
against the embryonic form of AChR play an important role in the pathogenesis of neonatal myasthenia gravis. As such, the present invention describes a method for identifying an association between a trait (such as a clinical response to a drug that targets CHRNG) and a haplotype or haplotype pair of the CHRNG gene. Furthermore, it is useful in screening assays, for the development of diagnostic tests and for therapeutic treatments of myasthenia gravis using gene therapy. This oligonucleotide sequence is a human primer extension DNA oligo used for detecting the CHRNG haplotypes of the invention.

  The invention comprises a method for the PCR amplification of nucleic acids. The method involves a set of primers, where two of the primers are in solution and at least two other primers are attached to a solid support. The method of the invention can be used for the analysis of a nucleic acid or a mixture of nucleic acids, including: single-stranded present DNA solecules, double-stranded DNA molecules and mRNA molecules. The PCR primer of the invention
  extension of oligonucleotide primers, comprises 2 oligonucleotides in solution, 2 attached to supports and both share complementary sequences.

Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
  Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
  The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.

The invention relates to a novel RNA retro-position comprising the transcription of an RNA containing a 3' UTR fragment of a LINE in cells; cand trans-positioning the ORF protein of such LINE after expressing from other than the RNA. The invention further comprises a similar method in which the transcription of an RNA containing a 3' UTR fragment of an APE domain-carrying type site-specific LINE in cells, and expressing the ORF protein of the LINE in such cells; or transcription of an RNA containing can virulate thereby modifying a retro-transposition of an RNA containing can ubstituting the endounclease domain of the LINE by that of another LINE by cabstituting the endounclease domain of the LINE by that of another LINE calls thereby modifying a retro-transposition also includes a retro-transposition vector with RNA encoding the 3' UTR fragment of a LINE but transposition of such LINE. The invention also includes a retro-transposition of the endounclease domain of the encoded ORF protein in cort expressing the encoded ORF of the LINE; a vector encoded ORF protein in cort the site-specific LINE by the endounclease domain of the encoded ORF protein in cort the site-specific acids of an endounclease domain via substitution to a chromosome using a virus vector, which is applicable in capening specifically at LINE, and with little damage to the host due to the gene transfer. This polynucleotide sequence represents an cut of the exemplification of the invention.

  This invention relates to a novel method for the optimisation of primer libraries. Specifically, it refers to increasing the affinity of short beingoniectide primers, also known as extendable oligos (EOs), for their template sequences. The present invention describes improved methods for sequencing and the linear and exponential amplification of DNA that can amplification, strand displacement amplification of DNA that can amplification, strand displacement amplification and isothermal DNA amplification. Accordingly, these extendable oligos with improved specificity and affinity are particularly important in fields ranging from biotechnology and agriculture to medical research. This oligonuclectide sequence is an extendable oligonuclectide that includes an adenine replacement 2,4 diaminopurine nuclectide analogue in the catch region, and is useful for both DNA sequencing reactions and PCR
  Increasing the affinity of an extendable oligonucleotide (EO) for a target nucleic acid, for providing primers having improved specificity, comprises hybridization of the EO to a template oligonucleotide (TO) and extension of the EO.

condonuclease cleavage site. The functional tail is attached through a phosphote group to the 3' terminal nucleotide of the phosphote group to the 3' terminal nucleotide of the object of the oligonucleotide, and the reporter group is not detected when the functional tail is attached to the oligonucleotide. Methods of detecting a target nucleic acid involve contacting the sample with an AP site probe and an AP endonuclease, incubating under conditions that allow the AP endonuclease to cleave the phosphodiester bond, and detecting the reporter group on the cleaved functional tail. The method is exquisitely reporter group on the cleaved functional tail. The method is exquisitely reporter arget because the AP endonuclease preferentially cleaves the prosphodiester bond when the oligonucleotide is hybridised with a fully complementary nucleic acid sequence. The present sequence is that of an enhancer sequence, which was used in an example from the invention illustrating the substrate specificity of Escherichia coli endonuclease and a transpared to the 5' end of a target nucleic acid

detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the Kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related

   The present invention relates to a method for preparing a composition for inhibiting recruitment of perivascular cells of smooth muscle type using a VE-statin protein (1, ADR27861-ADR27863 and ADR27902). VE-statins, coluble factors secreted by endothelial cells of the blood vessels, block recruitment of perivascular smooth muscle cells (but do not affect their proliferation), so inhibit angiogenesis. VE-statins, also their peptide tragments, nucleic acids encoding them and vectors containing this nucleic acid, are used for treating cancer, retinopathy, atherosclerosis and restenosis, including in gene therapy. The VE-statin mucleic acids can also be used to produce transgenic animals (for studying the VE-statin proteins and genes); the VE-statins are used to occreen for specific (ant) agonists, and antibodies specific for VE-statins can be used to determine expression profiles, particularly for diagnosis of diseases associated with VE-statins. The present sequence was used to illustrate the structure of the murine VE-statin gene.

The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nuclectide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.

capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.

The present invention relates to novel retinoic acid-inducible, retinoid—metabolizing proteins (ADV90763, ADV90765 and ADV90793) and their coding sequences (ADV90764, ADV90766 and ADV90793) and their coding proteins contain a heme-binding motif characteristic of the cytochrome P450 proteins. The P450RAI family has been designated CYP26. The retinoid—metabolizing proteins are useful for screening (M1) drugs for their effect on the activity of the retinoid—metabolizing proteins. (M1) involves exposing cells transfected with a retinoid—metabolizing protein coding sequence to a drug, where the transfected cell expresses the protein; and determining the effect of the drug on the activity of the protein; where the protein oxidizes a retinoid or hydroxylates a retinoid at the C4-position of the bera-ionone ring. The drugs screened by (M1), are useful for inhibiting retinoic acid metabolism, preferably retinoic acid hydroxylation in an organism for treacting diseases such as cancer, actinic keratosis, oral leukoplakia, secondary tumor of head and/or neck,
  Screening drugs for their effect on activity of retinoid metabolizing protein, by exposing cell transfected with nucleic acid molecule encoding protein and expressing protein, to drug, determining effect of drug on
  basal cell carcinoma, skin cancer, premalignancy associated actinic keratosis, acne, psoriasis, ichthyosis, eczema, etc. The present primer was used during differential mRNA display.

   The invention relates to retinoic acid (RA)-inducible retinoid metabolising proteins found in human (hP450RAI), mouse (mP450RAI) and zebrafish (zP450RAI) and to nucleic acid molecules encoding such proteins. P450RAI is a novel member of cytochrome P450 family and is also referred to as CYP26. The invention is useful for determining protein which oxidises retinoid. It is also useful for inhibiting RA hydroxylation in an organism such as human who is need of treatment
  against a disease chosen from cancer, actinic keratosis, secondary tumour of the head and/or neck, basal cell carcinoma, skin cancer, acne or psoriasis. The present sequence is a PCR primer used to isolate zP450RAI gene using differential display procedure.

The invention relates to a method whereby photosensitized substance is tradiated with optical beams of different wavelength, so as to induce multiple excitations of photosensitized substance. Also included is a biomolecule damaging apparatus. The method is used for damaging biomolecules, by photosensitized one-electron oxidation reaction in photodynamic therapy. The methods enables damaging of the biomolecules effectively and quickly, while reducing the strain on patients and the workload of doctors. The present sequence is an oligonucleotide used in

   The invention relates to a microsomal preparation of a cell that has been transfected with a nucleic acid molecule encoding a protein, or of its descendent cell, where the protein oxidizes or hydroxylates all-trans retinoic acid at the C4-position of the beta -ionone ring, the nucleic acid molecule comprising a nuclectide sequence that hybridizes under high stringency conditions, where high stringency conditions include a wash steep of about 0.2xSCC at 65 deg. C, to a polynucleotide having a fully defined 1850 base pairs sequence given in the specification, the microsomal preparation comprising the protein. The microsomal preparation is useful for metabolizing retinoic acid in an organism or cell. This sequence corresponds to an oligonucleotide used for differential display analysis of the zebrafish P450RAI gene which encodes the P450RAI protein involved in retinoic acid metabolism.
